when you open the torrent site and click on the download button to download your file. but i will tell you a way to make the tool do exactly what you want. I have also made a video showing the tool in action. A: You can use novu and ffmpeg to concat both subtitles in to a single file without the need of using your application. I have tested it myself and it works great. nvu is part of the default installation of Ubuntu, I think you just need to install ffmpeg: `sudo apt-get install ffmpeg` This will install ffmpeg in the command line. To make it available to nvu (as a nvu plugin) you have to install the nvu-plugin-ffmpeg. Use the following command to install it `sudo apt-get install nvu-plugin-ffmpeg` Make a ffmpeg script that will concat the files in the directory you selected. `ffmpeg -i Selected_video.mp4 -i Selected_subtitle.srt -c copy -map 0 Selected_video+_video_subtitles.mp4` Make a nvu script that will perform the concat. `#!/bin/bash ffmpeg -i $1 -i $2 -c copy -map 0 $3` Execute the script `chmod 755 ~/nvu-script.sh` Then you can select all video files and selected subtitles with nvu and press the "concatenate" button. Here you can find more information about nvu and scripts. I've tested this and it worked for me. Q: Use list comprehension to group dictionary key and values, and then to combine into one list I'm working on a script to group together the data from multiple dictionaries that are given. I am trying to get the dictionaries to run through the list comprehension and then combine all of them into one list, but I'm getting a string index out of range error when I try to put them into one list. This is the code that I have so far: `from itertools import chain def group_dicts(lists): for dictionary_list in chain.from_iterable(lists): print(dictionary_list) print`
