On the mechanism of intermolecular tandem nucleophilic substitution reactions of trifluoromethyl trifluoromethylsulfonates: role of beta-elimination in the catalytic cycle. [structure: see text] Luteolin-7-O-(beta-D-glucopyranoside) 3, a biologically active flavonoid, forms trifluoromethyltrifluoromethylsulfonates in moderate to good yields during its synthesis. These compounds have been studied by using a combination of different methods: NMR, MS, HPLC, GC, and X-ray crystallography. It has been found that the catalytic conversion of 3 into 4 is an addition/elimination process, with an end-on addition of the trifluoromethyl group by the C-7 hydroxyl group of 3 followed by a beta-elimination step as the rate-determining step. This result is in contrast to our previous studies of the catalytic process in which both the C-7 hydroxyl group and the 3-OH group are involved. The elimination step is not observed with trifluoromethyltrifluoromethylsulfonates bearing electron-withdrawing substituents at the alpha-position. A stereochemical analysis of the mixture of (E)- and (Z)-3-hydroxytrifluoromethyl trifluoromethylsulfonates allows the conclusion that (Z)-3-hydroxytrifluoromethyltrifluoromethylsulfonates are more reactive than (E)-3-hydroxytrifluoromethyltrifluoromethylsulfonates in the catalytic process. The possible mechanism of the catalytic process has been proposed. NYCC '13: Get To Know The League Of Awesome's Newest 'Superman Unbound' Author The Blogfather always seems to be busy.
