KEYMACRO provides intuitive and convenient functionality for controlling terminal services (TS) host access, session idling and monitoring, in addition to enabling users to create, manage and lock their active terminal services sessions. It uses the same concepts as the existing Terminal Services Admin tool, which is based on its same user interface. KeyMACRO supports both session management and session control, which are key elements when monitoring TS host access, session idling and usage. Session management allows one to view the list of active sessions, identify and lock session resources, lock session, revoke session, and change session session settings (IP address, host name, etc.), while session control provides the ability to shadow, suspend, resume or control session resource usage (CPU usage, memory usage, etc.). KeyMACRO enables one to create either local or remote terminal services accounts and administer their usage using a web browser-based GUI. By using the wizard, a new remote TS account can be created in just a few simple steps. On the web-based version, only minor settings are required, however on the client-based version, you will also be required to specify the computer name, domain name, as well as the IP address or host name. The goal is to provide a simple and convenient tool that can handle all of the basics of TS administration, as well as provide advanced functionality. The client-based version comes with a wizard that supports the creation of remote TS accounts, which will allow you to create a new TS user account, as well as administer the resource usage of the account. The client-based application can be installed in local computers that run Windows, while the web-based version can be used on a remote computer connected to a terminal services server. KeyMACRO provides a wizard that allows one to create a new TS account, as well as view the list of currently active sessions. The wizard also supports the creation of both local and remote TS accounts, while the web-based version supports the creation of remote accounts only. One can also select a remote computer by browsing the list of currently available computers on the server, or, if the remote computer is not in the list, can manually enter it using the fields provided. The remote computer can then be previewed and if a user is logged in, the list of all active sessions will be displayed. One can lock the session, shadow it or suspend it, as well as make changes to its settings, which will be saved once the user clicks the Apply button. 70238732e0
