

A: Actually the preview version of faceshift Studio 1.1.05 is already released. You can download faceshift studio 1.1.05 from this link. There is a discussion on this in the comments section of this link which say that it could be a beta version. In this blog post I will describe why the LCD-BMP (German: „Liquid Crystal Display – Backlight Module“) displays, and why we are using it for the Zope-pluggable Web service. The Zope-pluggable Web service The Zope-pluggable Web service is a new web service provided by the Zope-framework. The web service allows a user to register a url and creates a service object based on this url. This service object is accessible via web-browsers, and also from other Zope applications. Why the LCD-BMP displays? As shown in the diagram below, the Zope-pluggable Web service is based on the Zope-service locator pattern. This service locator is based on the DynamicProxy-component of the Zope-framework. The DynamicProxy locator is configured using a ZCML file. The Zope-pluggable Web service is a subclass of the base Zope-service locator class, and uses the function getServiceDescriptors() of the base locator to obtain a set of service descriptors. The LCD-BMP displays the contents of the ZCML file, which is the file shown in the diagram, and also the contents of the web service URL, which is the „, in the diagram. The contents of this URL are dynamically created, and are therefore changing at every request to the Zope-pluggable Web service. These contents are passed as parameters to the LCD-BMP, which then creates a VGA-resolution image from the parameters. This image is then displayed on the backlight. How to make the LCD-BMP display The image display is controlled using the writeImage()-method of the LCD-BMP. The LCD-BMP first loads the contents of the image, using the function loadImage()-method. Using the setBackground
