

What's New in the?

ZipAda is a library that deals with the ZIP file format and offers the users the possibility to create, access and extract the contents of ZIP archives. The full source code of ZipAda is in Ada, compilable on every compiler and for every system. It is fully validated and is easily to use in your own applications. How to use: \* Free Software \* Open Source \* No registration, no license... The archive is structured in multiple files. Each archive has several parts: \* A file structure. \* A file header with descriptive information about the file. \* A central directory. \* A content directory. \* The file content. Usage of the library: ZipAda has a simple and clean syntax. The main interface is a callback function. You can do all the work through the functions of the library, but you can also use the library with only one function. For example: function Get\_Text (File\_Reference : Archive\_File\_Reference; File : Ada.Streams.Stream\_Element\_Array) return String; This function does all the work. The text you want to extract is not stored in the archive but in a file. ZipAda is organized in several sub-packages that contain the functions to create, extract, access, check, count, close, and delete a archive. Creation: Creating a zip file is very simple. The first step is to decide what the name of the archive will be. The name of the file in the archive must be given in the form: 1 - The file name 2 - The file path The path of the archive is not important. You only need the archive name, and you can put it in the resource path, or on a specified drive. For example, you can create a ZIP archive called foo.zip on a specified drive: Drive "C:"  
Create\_Zip("foo.zip"); You can also create a zip archive from a program running on another computer: Create\_Zip("smth.zip","hostname.example.com",rba,rba); The second step is to create the archive structure. You have three files in your archive: 1 - An archive structure file, 'archive\_file.adb'. This is an optional file. If you don't create this file, you have to manually create the archive structure and the central directory. 2 - A central directory file, 'central\_dir.adb'. This is an optional file. 3

---

**System Requirements:**

Adobe Creative Cloud Compatible Minimum OS: Windows 7 or later CPU: Intel dual core, 2.4 GHz Memory: 4 GB RAM GPU: DirectX 9.0c Compatible video card with at least 1 GB of video memory DirectX: DirectX 9.0c Compatible video card with at least 1 GB of video memory Storage: 600 MB available space for installation Additional Notes: The following products are not supported in this version. Product: Agave
