More particularly, the present invention relates to an optical connector for optically coupling between an optical fiber cable and an optical element through a ferrule. 2. Description of the Related Art Optical fibers are drawing attention in the recent years as optical transmission means and wavelength-division-multiplexing transmission is advancing. The optical fiber is used as optical wiring, and connectors for connecting optical fibers are now being developed. In particular, the demand for connectors is high among users who require ease of connection of optical fibers. A conventional connector is generally provided with a pair of clamping pawls formed to protrude from a rear surface of the connector on both sides. Each of the clamping pawls is biased in a direction to clamp the optical fiber inserted in the connector with a spring force. The clamping pawls are engaged with the optical fiber to be inserted into the connector. In a case where the optical fiber is accurately aligned with the optical element and a small amount of displacement is present between the optical fiber and the optical element, the clamping pawls clamp the optical fiber to the optical element. This position is called "primary locked position." In a case where the optical fiber is not aligned with the optical element, the clamping pawls are in contact with the outer surface of the optical fiber to keep the optical fiber in the connector. This position is called "secondary locked position." In a primary locked position, for example, when an excessive force is applied to the optical fiber, the optical fiber will be damaged. Therefore, in order to avoid the damage of the optical fiber, an insulating sheath of the optical fiber is compressed by the clamping pawls, and the primary locked position is firmly maintained by the compressed insulation on the outer surface of the 3e33713323
