The initial release version was called AutoCAD 2. Autodesk gradually added more and more functions to AutoCAD. Over the years, additional functionality has been integrated into AutoCAD, such as rendering, 2D and 3D viewing, customization, archiving, and network-based access. On the desktop, AutoCAD products are available in the USA in several languages, including English, French, Italian, German, Spanish, Portuguese, Japanese, Simplified Chinese, and Traditional Chinese. Over the years, AutoCAD has seen many variations of the desktop application, including both 3D and 2D views. Starting with AutoCAD 2015, AutoCAD has two application types, AutoCAD LT and AutoCAD LT Advanced. AutoCAD LT is the classic desktop version that is the ancestor to AutoCAD 2017. AutoCAD LT Advanced is a more modern AutoCAD release than AutoCAD LT. AutoCAD LT Advanced is available as a standalone application or through the internet. AutoCAD LT 2.0 is a typical desktop AutoCAD release. The initial release, AutoCAD LT 2.0, was released in November 1998. AutoCAD LT 2.0 is based on AutoCAD version 2.0. AutoCAD LT 2007 is the latest version of the classic desktop AutoCAD release. It was released in November 2007. The latest release of the classic desktop version is AutoCAD LT 2013, released in June 2013. AutoCAD LT 2017 is the latest version of the classic desktop AutoCAD release. It is the first release of AutoCAD Classic that is available on a per-user basis. As AutoCAD Classic is a per-user application, each user has his or her own license and installation. This means that the license file can be updated and the installation upgraded on a per-user basis, without needing a software installation from the AutoCAD software vendors. AutoCAD LT 2018 is the latest release of the classic desktop AutoCAD release. It was released in May 2018. AutoCAD LT 2019 is the latest release of the classic desktop AutoCAD release. It was released in July 2019. AutoCAD LT 2020 is the latest release of the classic desktop AutoCAD release. It was released in January 2020. AutoCAD LT 2020 allows new users of AutoCAD Classic to familiarize themselves with the application quickly. While

For programming in C++, there are three ways to embed in AutoCAD: programming in Visual C++ and using the VB6 component, AutoLISP (AutoCAD's native language) or Visual LISP, and the AutoCAD ObjectARX API. AutoCAD's .NET language allows a programmer to use VB.NET, C#, or any of the .NET languages. AutoCAD's .NET language is analogous to VB.NET and uses the same ADDLIB system, but has not the .NET Framework, the AutoCAD plugin architecture, or the VBScript. Instead, it has the AutoCAD API itself. AutoCAD has its own data format for drawings, which uses a hybrid of XML and its own proprietary format. The file type is an XML file, and it uses the EObject format which is like the IDAT file format used by the Windows application Portable Device Kit. The Block Object toolbox (BO) allows AutoCAD users to create, edit, convert, and load 2D (and 3D) blocks into CAD applications, 3D rendering applications, or presentations. AutoCAD allows users to load DXF documents. Text and Paragraph Boxes Text and Paragraph Boxes are AutoCAD's means of grouping line elements for the purpose of editing and viewability. Text boxes are only useful in AutoCAD LT, while paragraph boxes are always available. Paragraph boxes are useful when editing an AutoCAD document, where you need to edit the characters of a line. Instead of entering the characters one by one, you can group them into paragraph boxes, which makes it easy to enter them when you need to. The line is not editable within the paragraph box. Paragraph boxes can be nested, or they can span multiple line elements. Text and paragraph boxes can be nested as well as span multiple line elements. In the following example, one paragraph is enclosed within another, and the line is editable within the inner paragraph box. Line Line Line (alt) Ellipse Circle The next example shows how a line can be enclosed within a text box. Text Box Circle Ellipse A third example shows how a line can span multiple line elements. The present invention relates to vehicle coverings and more particularly to a multilayer cover for a vehicle. Such coverings are known in various embodiments and they are mainly used for motor vehicles but they may also be used in other vehicles or even in other goods such as airplanes and ships. In particular, coverings which are of an elastomeric type, both on the outer surface and on the inner surface, are very widespread in the industry, for example for protecting the vehicle from impact with solid and fluid objects such as stones and water. In fact, such a covering is widely used for the external portions of motor vehicles as rain-capes, top covers, mudguards, satellite dish covers, etc. It is also used on the rear portion of a vehicle, for example to hide the flaps of the back doors from the view of the passengers. However, the use of an elastomeric covering alone, to protect the interior of the vehicle, presents problems in that the material used is not impermeable to water and therefore water tends to penetrate the material, thus leading to leaks which accumulate and are difficult to remove. Moreover, due to the action of sun and rain, the material used on the vehicle's exterior portion is affected by sun and rain to change the appearance of the vehicle, in particular the coloring thereof. The object of the present invention is to provide a multilayer covering which is impregnated with a waterproofing agent. Another object is to provide a covering which can limit the passage of water into the interior of the vehicle. Yet another object is to provide a covering which does not alter the appearance of the vehicle. The above objects, among others, are attained by a multilayer covering for a vehicle, comprising a first elastomer layer which is waterproof and a second elastomer layer which is partially permeable to water, in which the first and second layers are adhesively joined to each other. The elastomer layer comprising a water-proofing agent that will penetrate inside the layer and will be discharged through pores located between adjacent elastomeric layers. It is possible to provide a covering which is extremely impermeable to water and which does not affect the appearance of the vehicle. The present invention provides a multilayer covering for a vehicle, comprising a first elastomer layer which is waterproof and a second elastomer layer which is permeable to water, in which the first and second layers are adhes
