The utility displays the factors of an integer specified by the user. The user is able to change some of the main options like: To find the prime factors which have not been displayed yet. To ignore a certain part of the number. To ignore the number's multiples. The utility is very simple to use, but is also fast. It uses a combination of a sieve and a prime polynomial. The way it works is simple: a factor of the number will be removed from the sieve as a prime. It then calculates a prime polynomial which will be added to the sieve as the next prime. As a result, the next prime is displayed as soon as the user types a new number or presses the Next button. If the user types a number in the wrong format (such as calling it too big or too small), it will show an error message. Finally, it will not let the user exceed a user-defined time interval when calculating the prime factors. Here is a more detailed description of the way the utility works: The input box is used to specify the integer that you want to find the prime factors of. The Convert button will convert your number into a very long string (such as a hexadecimal string) to help you identify the value when the user types it in. The Next button will be shown until the user reaches the end of the sieve, at which point the next prime will be displayed. The Cancel button will cancel the operation and return the user to the first input box. A prime factorization algorithm was found in the Web which computes a set of prime factors for a given number in a minimal time. The Web site (comes with a Java program that implements this algorithm. This utility reads the prime factorization of the specified number from the specified text file and prints it to the screen. The text file should contain a single line of the prime factorization of the given number. Example: # Prime factorization utility written by Serge Chesnov java primes.PrimeFactors 1 2 3 4 5 6 7 8 9 10 1 2 3 4 5 6 7 8 9 10 Files: primes.PrimeFactors.jar - The main file of the program primes.PrimeFactors.txt - The text file that contains the prime factorization of an integer A: Visual Basic.NET - 774, 1443, 609, etc using System; using System.Collections.Generic; using System.Linq; using System.Text; namespace ConsoleApplication1 { class Program { static void Main(string[] args) { string line; int number; string[] primeFactors; do { Console.Write("Enter number: "); number = Convert.ToInt32(Console.ReadLine()); if (number
