A hydraulic pump that is not used is a wasted energy resource. If you are designing a product that will require a hydraulic system to operate, you should take into consideration that the flow of hydraulic fluid is something that you cannot avoid and it's very much of a "waste" in the end. Of course, you will need to calculate the flow rate of the hydraulic pump and its specs accordingly. You can also have a check for the pressure loss of the hydraulic pump and lower the pressure by using a smaller pipe size. Statistical modeling and simulation of atherosclerotic disease development and progression. Since atherosclerosis is one of the primary causes of morbidity and mortality, there has been a great deal of interest in developing mathematical models to quantitatively describe the different stages of the disease and to investigate how to combat the disease. In this work, a statistical model was constructed to describe the progression of the disease in terms of the initiation and progression of atherosclerosis. The model was also used to analyze the relationship between environmental factors and disease progression. The model provides an extensive database of atherosclerotic lesions, in both animals and human subjects, and can therefore be used to investigate the factors influencing atherosclerotic lesion formation and growth.
