To evaluate the diagnostic value of intraoperative Cystoscopy (CM) and visual inspection in vaginal fistula (vf) management. From May, 2010 to October, 2011, 20 vf patients in Peking Union Medical College Hospital were enrolled, all had routine examinations and intraoperative CM and visual inspection. The results of routine examinations including urine culture, vaginal cytology, CT and digital examination were recorded. Meanwhile, the results of intraoperative CM and visual inspection were also recorded. Then fistulas were cured by simple suturing of the fistulous tract and no further operation. Forty-four (44) vaginal fistulas were diagnosed, among which 36 (81.82%) were the result of operative scar endometriosis. The other 8 patients had suffered from hysterectomy, episiotomy or even pelvic trauma; 1 patient was seen with both vf and fistula, which were caused by malignancy; 1 patient was seen with vf caused by iatrogenic injury. The fistulas were all cured by simple suturing of the fistulous tract, no further operation. The diagnosis of vf by intraoperative CM and visual inspection is simple and easy to be implemented. It's not difficult to cure vf by simple suturing of the fistulous tract. The pack was prepared in his laboratory, supplied with a small quantity of oxygen, and was first flown on August 27, 1912, reaching an altitude of 23,600 feet, and a speed of 93.8 mph. On March 24, 1913, at the annual convention of the United States Fraternal Protection Association (USFPA), Merrill commanded the first test of the Army's new two-man Airship No. 12, which had been fitted with a steam-powered engine, its fuselage strengthened, and strengthened shock absorbers. The test flight covered 17.1 miles in 39 minutes and reached an altitude of 6,800 feet. The craft proved unstable, however, and it was quickly relegated to a test-flying role. Its replacement was the one-man Scout, which replaced the earlier envelope-
