Genomic structure and chromosomal localization of human Delta5-3-ketosteroid reductase gene. The gene for 3 alpha-hydroxysteroid dehydrogenase (3 alpha-HSD) has been cloned and sequenced. The cDNA sequence predicts that the enzyme is composed of 516 amino acid residues with a molecular mass of 53 kDa. The intron-exon structure of the gene was determined by a combination of recombinant DNA, reverse transcriptase, and S1 mapping techniques. The gene has three exons of 30, 9, and 137 bp. The minimal promoter has been defined by 5'-deletions of the genomic fragment containing the transcriptional start site. The promoter region has two GC boxes and several other transcriptional regulatory elements. The promoter shows preferential expression in human adrenal tissue and is markedly activated by ACTH treatment.

Q: Facebook FQL migration error in postgres I'm using the following FQL query, which worked fine before I migrated to postgres: SELECT p.id, p.type, p.user_id, u.message, p.created_time, p.updated_time, p.object, u.message_id, u.message_tags FROM stream WHERE stream_target_id IN (SELECT id FROM interaction WHERE target_id = {value}) AND uid IN (SELECT uid2 FROM profile 82138339de
