UFT is a feature of Project Mercury that makes it easier to conduct functional testing, which is a process of testing how a user experiences a software application. A functional test includes the following: Acceptance tests - A basic functional test involves having users do certain activities in the software, such as trying to log on, save a file, or change a setting. This type of test can be done very quickly using UFT. UI Testing - UFT enables you to see how a user interface works, how it responds to input, and how it may interact with the rest of the software. To do UI testing, you must run a UI test in UFT. User acceptance testing - User acceptance testing is a means of testing that involves having users do a set of tasks or procedures with the software application and checking how they feel about it. For example, a user may be asked to try to complete a task, save a file, or change a setting. Automated regression testing - This is a set of tests that check for errors in the software. It involves running the application over and over again and checking how it behaves, such as the size of a file, how long it takes to load a page, or whether it recognizes certain characters. Regression testing - A regression test verifies that a bug has been fixed. This type of
