The Terasco XP Button Control will help you to create applications for Windows 98/2000/XP. The control is designed to simulate the Windows XP button. This is a very convenient way to make the buttons in Windows XP look like in Windows 98. Effects of tocopherol, lipoic acid, riboflavin and alpha-tocopherol, but not of other antioxidants, on mitochondrial function. Although a number of antioxidants are capable of preventing the production of reactive oxygen species and of inhibiting oxidative damage of biological substrates, the basis of this protection is not understood. We have now compared the ability of various antioxidants to protect the activity of the mitochondrial electron transport chain and ATP synthesis. The effects of all antioxidants studied were concentration dependent and the order of potency in protecting various mitochondrial functions was alpha-tocopherol, tocopherol, lipoic acid and riboflavin. When the concentrations of antioxidants (mM) in the incubation medium were normalized per millimole of the substrate oxidized, these ratios were also as follows: alpha-tocopherol:tocopherol:lipoic acid:riboflavin approximately 1:1:1:0.4. The above order of potency in protecting the mitochondrial functions correlated closely with that previously reported for the prevention of lipid peroxidation. Because some of the lipid soluble antioxidants may gain access to the mitochondrial matrix and because lipoic acid has been shown to inhibit succinate dehydrogenase activity, the present results indicate that some of the lipid soluble antioxidants may have an effect on mitochondrial function. Effect of non-contact-angle induced changes in the flow around a horizontal cylinder on the drag force. We calculate the lift and drag coefficients for a cylinder with rigidly fixed sides in a uniform flow and consider the effect of three different types of surface disturbances on the flow around the cylinder. In particular, we consider the effect of (i) changes in the flow near the walls of the cylinder and (ii) changes in the normal flow velocities on the cylinder surfaces. We consider three different types of disturbances: a cylindrical capillary, a spiral-shaped capillary and a surface that changes both the curvature and normal flow velocities simultaneously. In contrast to previous studies, we focus on the effect of the flow disturbance on the lift and drag coefficients and consider the effect of the flow disturbance on the angle of repose. Our numerical results are in good agreement with those of previous studies on similar problems and
