LeaveTracker solves your problems by providing a practical solution for managing employee leaves. Its main idea is to create a simple and comprehensive system in which you can manage over 100 leave types by your own, and even get a statistical view on all of them. All leaves are listed by employee in a graphical way and are classified by type. You can perform

custom accumulations and activate a cash deposit system to be kept as a fund for future leaves. All leaves can be accumulated by employee and you can create a variety of monthly leave limits that are configurable. You can perform accumulations for a specific day of the week, month and year, for a given employee and for all of them. By default, all leaves are considered a paid leave, but you can also set accumulations for unpaid leaves, and even holidays. Enter the breaks by yourself or import it from CSV files. Maintain a source file To achieve this, a source file is created to which the data to be saved is copied. The source file can be named whatever you like, and you can also change its extension or upload it to a server with FTP. The created backup file can be any format supported by Windows. A convenient format is ZIP. Bamboot supports ZIP and RAR, but you can also convert your ISO file to ZIP if needed.

Restore a source file This function is activated by clicking on the "restore" icon. This button opens a standard Windows file dialog that lists all the files contained in the source file. The user can choose the ISO file to be restored and then initiate the restoration. The ISO file is copied to the destination, where the application allows you to see the progress. Restore to a new ISO file During the restore process, the new ISO file is created and
