This application installs or starts a program as a service, even if the program is not installed at the moment. nssm Installation: nssm may be installed using msiexec /i or using msiexec /i "servicename" nssm Usage: nssm install "exe path" [option] Sample Usage: nssm install mstsc.exe Source Code: The source code for nssm is available on GitHub. A: I found another solution that works for me. Since I'm using VSTO, I want to use the SIF service helper that is part of it. Here's how I handle restarting the service. void restartService() { // First get the Service using SessionInterface.GetServiceObject // Then set the ParameterValue of the service, as I need to change it. ((IServiceProvider)ServiceObject).SetParameters(((IServiceProvider)ServiceObject).BindingContext.Parameters); // Then restart the service using WmiClient.ExecuteCommand. ((WmiClient)ServiceObject).ExecuteCommand("startservice /reboot", 0); // Resume execution //WmiClient.ExecuteCommand("ExecuteCommand", "REBOOT", 0); // Again, to stop the service again, do this //WmiClient.ExecuteCommand("ExecuteCommand", "STOP", 0); } S'pore 'World War' season FESTIVALgoers were promised a thrilling TV drama about what it is like to fight and kill for the sake of your country. What they received was a staggering epic, based on an incredible true story, about two lost boys who find themselves fighting for their freedom in the ashes of a world war. The real-life David and Simon Chrapstek are the brothers from world war II in a different guise. In this new documentary series, Simon takes us back to their story. "Over the course of five episodes, 'World War' will explore the stories of the Chrapstek brothers

Nssm Crack+ License Key

nssm is a unique service helper app that provides a valid alternative to Microsoft's srvany.exe, an app that allows users to run executables as services. The main issue with srvany and other helper programs of the sort is that they are only valid when the programs they are running don't fail. This is where nssm comes into play, as it monitors the running service and, if the service in question dies, it automatically restarts it. This provides power users and people who run executables as services with a lot more confidence. When nssm is running, it automatically looks in the registry for the parameter key and tries to start the program listed in Application. This allows it to start in the directory listed in AppDirectory and bypasses the option flags listed in AppParameters. In short, the same values that srvany reads. Another good aspect of nssm is that it can be configured to share responsibility with Windows' services. For example, if an executable running as a service is stable, nssm can be configured to never restart it and let Windows control all the required recovery actions. Using nssm is quite straightforward: users must simply place the app somewhere on the system and just run it, as it does not require installation. Installing a new service requires users to use the following command: "nssm install." nssm Requirements: Microsoft.NET Framework 4.5 Microsoft.NET Framework 4.7 Common Language Runtime Version 2.0 Description of nssm: nssm is a unique service helper app that provides a valid alternative to Microsoft's srvany.exe, an app that allows users to run executables as services. What's New in the Nssm?

Restarts a program from another application if the first instance crashed. It is effectively a service helper. nssm Usage: nssm install. - AppDirectory parameter: The directory where the executable is located. For example: c:\Program Files\Internet Explorer\iexplore.exe - AppParameters parameter: This parameter specifies a set of flags that can be used when starting an application. See "srvany help" for more details. The following parameters are related to AppDirectory: OnlyAppIsSingleInstance: If set to true, nssm will configure itself to not restart the program if it was launched as a single instance (or a multiple instance process) and the process terminated. This option is intended to be used for executable files that aren't intended to be restarted. It is highly recommended that the AppDirectory be set to the original executable directory. That way, if the executable was launched as a single instance, it will be returned to its original state. Settings: The Settings are set in the configuration file, located in the ProgramData directory, which can be edited via the registry. This is useful if your computer has a custom configuration that differs from the defaults. nssm will read the current settings in this file. To use these settings, users must edit the nssm.ini file and add the following lines to the [Settings] section: key = AppDirectory value = %APP_EXE_PATH% key = AppParameters value = %APP_EXE_PARAMETERS% Where %APP_EXE_PATH% specifies the directory of the executable that nssm will be monitoring. %APP_EXE_PARAMETERS% specifies a set of flags that can be used when starting the executable that nssm will be monitoring. See "srvany help" for more details. To edit the nssm.ini file, users should be logged into the command line using the same account as the app. For example, if the command is run as c:\users\myname\example, the user should use the account my
