Modulation of electrophysiological activity of smooth muscles with cannabinoid agonists. Cannabinoids represent a group of psychoactive compounds, endogenous to mammalian tissues, acting as physiological modulators of many cellular functions, including smooth muscle tone. The present study is aimed at investigating the direct effect of the cannabinoid agonists (-)-cannabidiol (CBD) and N-arachidonoyl-dopamine (A-DA), on the intracellular signalling system of guinea pig ileum, uterus and kidney. The influence of CBD and A-DA on the intracellular Ca^{2+} signalling was investigated using fura-2 loaded smooth muscle cell preparations. The fura-2 technique was also applied to investigate the effect of the drugs on cyclic nucleotides levels. CBD (5-20 microM) and A-DA (10-20 microM) concentration-dependently decreased the Ca^{2+} signal associated with smooth muscle contraction. The same concentration of CBD and A-DA increased the level of cyclic AMP in smooth muscle cells. The effect of CBD on the level of cyclic GMP was biphasic: CBD (10 microM) increased the level of cyclic GMP in the absence of external Ca^{2+} and decreased it in the presence of Ca^{2+} within the range of 1 to 20 microM. CBD did not affect the level of cyclic GMP in the presence of high concentration of external Ca^{2+} (100 microM). In conclusion, CBD and A-DA appear to affect the smooth muscle contraction through Ca^{2+} channel mediated inhibition of Ca^{2+}-pumping activity and through an increase of cyclic AMP level. The results suggest that the cannabinoid agonists may act as regulators of smooth muscle contractile activity.Q: Best way to implement a Domain-Specific Language in F# What would be the best way to implement a domain-specific language in F#? For people who would like to make substantial investment, crypto are often the tool of choice. Among the several categories of crypto, token has been rapidly growing its market share. Token allows the owners to carry out their projects with the object of crowdfunding, and is also used by many to acquire crypto. Crypto tokens are generally traded on exchanges. They are normally used in the big cryptocurrency exchanges, to raise funds to carry out their projects, to scale their programs, or for very short periods. Moreover, they are generally traded at a discount, indicating that the company has generated more volume than anticipated. In the case of the exchange, it can be saved to pursue a second round of investment for the targeted project or to raise more funds. It is therefore essential to learn a few tips on how to buy and sell tokens. This guide will help you deal with the stages of such transactions and to choose the best exchange to carry out them. What is token? Token, digital form of cryptocurrency, is a piece of software having a unique name, consisting of a code and the alphanumeric characters representing the cryptocurrency. In the various digital currencies and tokens, the

alphanumeric characters are generally 40, allowing them to be easily compared to the alphanumeric characters of cryptographic systems. Tokens are also very similar to shares. A token denotes a proprietary right of the owner to allow the holder to exercise a privilege or to use a service, and that can be sold or given. Why purchase tokens? The aim of purchasing tokens is to participate in an ICO. This method is generally offered by innovative projects or public companies. It allows a company to raise a certain amount of funds to finance their projects or very ambitious programs. Unlike shares which are much more expensive to purchase, it does not represent much risk. They are generally the most liquid cryptocurrency, this is to say that they can be exchanged for fiat through an exchange at a high speed. Another reason to buy them is to trade for a discount. As an example, a company whose tokens are expensive to purchase or sell on an exchange offers them in exchange for tokens at a discount. This allows investors to benefit from such an opportunity and to participate in a second investment. At the same time, the choice of the exchange to carry out the ICO also depends on the type of token. For example, in case the value of the token varies from one exchange to another, the speed at which it can be converted
