Photoshop Express Adobe Photoshop Express is a simple, low-cost application that is designed to be used on small mobile devices such as smartphones and tablets. It contains just basic editing tools. It's often used to edit photos on a mobile device, and it has fewer features than Photoshop or Photoshop Elements but performs surprisingly well. * A small number of features, such as cropping, red eye reduction, and basic features like adding captions, are included, but that's it. * Light editing; no layers, no adjustments. It enables you to rotate, crop, resize, and color correct images quickly. * It runs quickly and is easy to use. ## Online Image Editing Services Online image editing services provide quick, accurate, and convenient services that can substitute for your main image editor. Online services often provide an onscreen version of the same features found in more powerful desktop image-editing software. These services are good options for those of you who want to edit images on your computer but who need additional photo-ed

I assume if you are reading this you have an active internet connection. If you haven't got Photoshop, or if you can't get Photoshop, there are other alternatives which might suit your needs. I'm going to be using Photoshop and Elements on a Raspberry Pi. *In some cases, Image Editing Software can be used from any Windows or macOS computer, but you might need to have Photoshop or Pixelmator.(usually you can install either of these using Chocolatey. (See links at the bottom of this article) If you don't have Photoshop, I'd recommend downloading a trial version of Photoshop first, and then installing from the re-named "Photoshop Elements 9" software. Installing the Software The first thing to do is install the software. I found instructions on the Raspberry Pi Foundation website to install the latest pre-compiled version of "Image Editing Software" or "ComputerCraft" as they are known. Remember that if you're going to use Photoshop or any other software that will access your regular hard disk drive, you'll need a SD card big enough to hold the content of your hard disk drive, so you don't need to worry about the Raspberry Pi's "bootdrive" or "root filesystem" filling up. You can find instructions to install the software from the Raspberry Pi website or from the links in the Resources section at the end of this article. I downloaded the latest version from the Raspberry Pi website. I downloaded Raspbian Stretch Lite and the "Image Editing Software" app, but it shouldn't matter what version you have or whether you have Windows, macOS, or the like installed. When I downloaded it, the app downloaded the Image Editing Software app and the Image J software to complement it. You could download "ComputerCraft" from the Raspberry Pi website and run it as a normal application. Setting Up the SD Card and HDMI Cable If you have access to a Raspberry Pi display monitor, you can use it for the system window. If you don't, you can connect the Pi to a standard video monitor using an HDMI cable. Here's what I did to get everything setup to work. My laptop's screen is a 23inch 1920 x 1080 display. The monitor and the laptop are both on 24-inch stands which I don't have. The monitor is angled and there is no stand that I could lay it on. I found 05a79cecff

This invention relates to a method for producing synthetic filaments which are heat resistant and suitable for the fabrication of carbon or graphite fibers, as well as fibers reinforced with such fibers. Filaments of carbon or graphite and carbon or graphite fibers are suitable for the fabrication of textiles, synthetics, and other industrial products. Graphite fibers, however, are expensive and are susceptible to breakage because of a low modulus, low tensile strength, and low Young's modulus. On the other hand, carbon filaments are not suitable for the fabrication of textiles, synthetics, and other industrial products because of their poor electrical and thermal conductivities and properties of insolubilization in solvents. A carbon or graphite filament is obtained by coating a carbon fiber or carbon fiber fiber with a carbon or graphite, as disclosed in, for example, Japanese Patent Publications No. 63-47706 (1394/1980), No. 2-14381 (May 13, 1990), and No. 2-18861 (June 8, 1990). The method of coating a carbon fiber or carbon fiber filament with a carbon or graphite is generally effective for preserving the inherent properties of the fibers to a large degree, such as mechanical strength and electron conductivity, but is not effective for improving the properties of the coated fibers with respect to electrical or thermal conductivity and solvent resistance. A carbon fiber, in particular, is a soft, opaque, and light-colored filament formed from a stabilized polyacene, as disclosed in, for example, U.S. Pat. No. 4,214,007. The raw filaments of carbon fiber and carbon fiber filament are bulky, and, accordingly, they cannot be processed into textile products having a high bulkiness and surface appearance (especially "snap feeling"). The prior art coating process is not successful for improving the surface appearance and the solvent resistance of carbon fibers without deteriorating their inherent properties. Carbon fibers are highly electrically and thermally conductive; graphite fibers are even more conductive than carbon fibers. However, graphite fibers are electro- and thermally insulating. Various methods of improving the properties of carbon fibers or carbon fiber filaments have been attempted. For instance, U.S. Pat. No. 2,454,504 (Guenther) discloses a method for improving the properties of carbon fibers with respect to their heat resistance, solvent resistance, and electrical conductivity by coating the carbon fibers with a
