Q: Referencing a parameterized resource in ODATA I'm trying to send a query to an ODATA endpoint and send the parameter value from my application for each entity in the response. Endpoint: /myendpoint?query=select+*+from+[data;mex=true] The parameter I'm sending is in the form: resourceName:value In my console, the values appear as following for each entity in the query: toplevel:"resourceName":"value" Instead of looking like this: toplevel:{"resourceName":"value"} Is there a way to make the toplevel reference a parameterized resource? A: You can have multiple properties in the OData document that represent the same entity. For this to happen the Web API can map multiple property names to the same OData entity. OData Media Type for these scenarios is "application/json"; the support is in Web API: The following JSON, { "startTime": "2015-09-25T11:22:00", "startMicroSecond": 0, "endTime": "2015-09-25T11:22:00", "endMicroSecond": 0 } will be mapped to the following entity: [{ "property1": "value1", "property2": "value2" }] The Web API will pass the query string values as OData query parameters: Or, if you are using the Web API v2 route templates you could have two query parameters like this:

Q: Randomly colored points on grid I'm trying to create a grid with a random range of colors. The random colors would be chosen from a list with 9 different colors. The grid would be 300 pixels by 300 pixels. The problem that I have with the code I wrote is that the same colors are repeated in random places of the grid. For example, the list holds the colors "blue", "green", "red", "light green", "yellow", "dark blue", "purple", "light blue" and "white". If the x-coordinate of the 300 pixels is 0, the first color should be used, if it's 100, the second color should be used and so on. x
