investing your hard earned cash. ARTS & ENTERTAINMENT By Kiley McVay, Digital First Media  
LOS ANGELES -- All work, no play, folks. That's what one man's over-worked life looks like on his Facebook page. Griffen Burke, a man who is basically a living zombie from work, had to force himself to get off his iPhone for dinner. Burke, a contractor, has been working most of the day on this photo, but even before that, he is on his phone catching up with his friends and talking to them. The photo was posted to his Facebook page Monday night

---

and has been getting enough likes and shares to post it to his Instagram account. A portion of the comments read: "Can I get a job like this? Would it stop my ADD?" "OMG how do u do that?" "You're crazy!" "I need a job like that." "I need a job like that." But the story doesn't end there.

Burke also appears to be a zombie if you look through his YouTube account, which has over 4,000 views. If you're curious, he also has quite the

Facebook page. a single representative of the Lakota people as a sovereign nation, then the first of America's so-

---

called "Indian Wars" of the mid-nineteenth century would never have occurred. The cause of America's "Indian Wars" was the unwillingness of American settlers to respect the sovereignty of the Native American nations that lived among them. The first skirmish between Sioux and settlers occurred in 1833 when a group of American settlers murdered Black Hawk and many of his followers at Wisconsin's Bad Axe River. When the incident was over, the settlers simply walked away. The United States responded to the murder by

---

sending the Army to the frontier and a "convict" army to the Bad Axe. Though most of the men had local ties, none of them were Indian, even though the Indian murderers were indeed American Indians. When the men returned to Red Cloud, he looked at them and said "they had killed him because he was an Indian."

In 1834, the men's superior officer took them back into the blizzard that was raging, and led them onto a precip

Menu Have been running into a dns issue for the last couple of months, and I've spent way too much time troubleshooting things. Last week I finally decided to start working from a fresh installation of OpenStack instead of the one that I had been running. I still have the Hetzner account, but I'm looking to re-partition my computers a bit, and have them all running with their own local bootstrap instances. This should be a bit simpler and less time

---

consuming. I use a MacBook Pro, so all this will be done on a machine with an external HDMI monitor. With that said, I'm going to use an external USB monitor that I also have available. So, here's the build. If you are going to follow along you will need a little bit of experience with GCE. Additionally, your OpenStack instance has to have the ability to ssh to the server box. On the official site for OpenStack, I found some information about setting up a key-based login. The first problem is that there is no clear reference to which ubuntu flavor

---

you should be using. I picked the latest release of Ubuntu. I then followed the instructions in the README for Ubuntu. The basic instructions are to create a public/private key pair, upload the public key to OpenStack and SSH to the server box. After creating the private key, I created an `.ssh/config` file and put the `id_rsa` into it. Just about any name is fine, just make sure the user is `www-data`. When you are logged in to the server, the file should be there. So now you can connect to the server box. However, once you get to the point where you wish to SSH to

---

the server, you get an error. The message that you will see is as follows: I've done this kind of thing in the past, but it was probably not done with a single machine. I can't figure out if this was a complicated problem or a complicated solution. So, I decided to go back to my internet search and look for some instructions on how to do this. I stumbled across a link to JUJU. The JUJU instructions didn't seem to work, so I got a web based proxy server running on my machine. The instructions didn't make much sense to me, but I followed

---

What's New in the?

**EVERYDAY EXPRESSIONS** Hey there, my name is Emma and i am a 22 year old graduate of Chicago State University, and an extremely good and fun person to be around. Love all sorts of things, from music to literature, and so much more in between. I'm a small town girl, so i honestly love the simple life. I'm here to describe the day to day joys of my life and the crazy adventures that i get into. So if you're reading this, you can expect a lot of funny, random content, along with thoughts on

---

things that can get me excited. I hope you enjoy! ^-^ NEWS The results of the 2014 midterm elections have just passed, and we've got big news coming up on our site very soon! I'm super excited to get this up and running, and to start telling stories and documenting the days and nights of everyday life. Now, i just need some awesome contributors, and are also looking for some amazing photo shoots. The deadline to apply will be the 1st of December. If you're interested in any of the following positions, please apply on the contact page:Q: Why does this

---

docker-compose not run my container in my local environment? I have a Dockerfile that I build using `docker build -t dns-ns-from-docker`. `docker images` shows the docker image listed as "none"... Then I run a Dockerfile that uses this image with `docker run -t -d -p 8042:8080 dns-ns-from-docker` I am trying to understand why I get the following message when I run `docker run` in my local environment and not when I run it from my Dockerfile: `~$ docker run -i -t -d -p 8042:8080 dns-ns-from-docker 10.159.233.161 - - [15/Jul/2019:20:43:50 -0400]`
