Adobe Photoshop Elements is a powerful graphics editor designed to help users, including hobbyists and professionals, quickly and easily create and edit graphics to publish to various media and devices. In this tutorial, we will learn to add a blur to a photo. Let's get started! Prerequisites Mac OS X 10.7.0 or later Final results of the exercise will be saved to your desktop. Step 1 Open a picture or create a new image document from the Files menu at the top of the screen. Choose Image -> Adjustments -> Blur -> Gaussian Blur. Step 2 Drag the Opacity slider to the left. You will find the center of the blur is placed directly over the photo. Step 3 Your image will appear blurred and the color will change, as shown in the image below. Click OK to close the panel. Step 4 Go to Layer -> New -> Layer via copy or Layer via paste. Hold the Alt key and drag this new layer below the existing blurred image. Choose Layer -> Layer Via Copy. Step 5 Double-click the new layer thumbnail to add a black background. Step 6 Apply some Gaussian blur to this new layer. You'll have two blurred layers (the original photo and your new layer with black background). You can edit the style and values of the blurred layers by selecting them using the Show Shadow and Show Highlights in Shadow/Highlight Display filter in the Adjustments panel. Step 7 Add a color-corrected layer over the blurred photo layer. Choose Layer -> Layer Via Copy or press Command + Drag the new layer above the blurred layer. Step 8 Add a new layer above the two layers. Use the same action to copy the layer with the color correction. Your image should look similar to the one below. Step 9 Highlight the new layer and press Delete. Choose File -> New Layer or press Command + Shift + N. Step 10 Use the Paint Bucket to fill the layer with white. Step 11 Add a Gaussian blur to the new layer. This will help hide the white color inside the layer. Step 12 Invert the new layer. Use the Stamp tool to place the "iii" emoji to see the result below. This invention relates to a radio receiver having a function of removing a reception signal from a picture signal for displaying the picture signal on a display device, and more particularly to a technique which is effective in removing a component of a desired reception signal from a picture signal by an electronic tuner. Heretofore, a switching section, such as a radio tuner or a video tuner, has been interposed in the reception path of a receiving antenna. In general, the radio tuner includes an electronic tuner and a radio receiving section. The radio receiving section contains a noise eliminator to remove noise components from a reception signal. The electronic tuner has a variable reactance circuit, as disclosed in Japanese Patent Unexamined Publication No. 9-274058. A first reactance is connected in series with a tuner coil of the electronic tuner, and a second reactance is connected in parallel with the first reactance. The second reactance is connected in series with a first and a second nonlinear elements connected in tandem, and further connected in parallel with a load resistor. The first nonlinear element has a negative resistance characteristic in the vicinity of a signal frequency, so that the impedance of the electronic tuner increases as the reception signal increases. As a result, the reception signal is attenuated to a lower level. The second nonlinear element has a positive resistance characteristic at a higher frequency, so that the impedance of the electronic tuner decreases as the reception signal increases. As a result, the reception signal attenuates to a lower level. With the electronic tuner described above, even if an input signal having a frequency higher than a receiving band of the reception signal is superimposed on the reception signal, the reception signal is removed from the picture signal. The video tuner includes a nonlinear element connected in series with a tuner coil, a video signal processor, a display device and a controller. The nonlinear element is adapted to remove a broadcast modulation signal component from a composite video signal, and the video signal processor demodulates a broadcast modulation signal with the composite video signal. The display device displays the video signal demodulated by the video signal processor on a screen. The controller controls the operation of the nonlinear element and the video signal processor. With a radio tuner having the construction described above, a desired radio wave to be received by the receiving antenna is attenuated by the first reactance connected in series with the tuner coil of the electronic tuner. In this case, when

Forty years on from the harrowing disaster in Chernobyl, a huge radioactive cloud is still hovering over Ukraine and the potentially catastrophic consequences of a full blown meltdown are not going away. The Soviet Union's Chernobyl power plant exploded in April 1986, creating the world's worst nuclear disaster, releasing tonnes of radioactive dust over an area the size of Sweden. Nearly 30,000 people were evacuated. Some still live with health problems years later. Alexei Litvinenko, the former FSB agent killed in London in November 2006 after the Russian state unsuccessfully tried to kill him, died as a result of radioactive poisoning. Leaked documents found in Litvinenko's flat showed that the Russian security service targeted those who posed a threat to Putin's rule. So, with that in mind, it comes as no surprise that efforts to finally clarify what happened at Chernobyl have been derailed by the current situation. Igor Sutyagin, a former deputy head of the Russian nuclear energy agency Rosatom who has spent the last five years investigating the disaster, said that Russian authorities are trying to make sure the truth is never heard. Sutyagin's latest, rigorous report focused on the near meltdown of a reactor's core. I spoke to him about why he believes the official version, given out by the government in the aftermath of the disaster, is not the whole truth. He believes it is likely that as many as three other cores overheated and broke open, causing an explosion. "The government felt it's better to say just one thing happened," he says. "The explosion killed nobody, there was nobody killed by the explosion. It also killed nobody by the fire. The accident was described in such a simple way that nobody even bothers to check it now. I don't think they are even still looking. They think there is no need to look any more." In this report, Sutyagin

made some important revelations. He showed that equipment at the site, including a giant cooling system, could not have been destroyed by the initial blast, as was initially believed, and that several minutes elapsed between the explosion and the fire. But it was the most startling of his findings that were censored by the government. He found two explosions in his report - caused by "resonant phenomena," a disruption of the reactor's internal neutron chain reaction - that might
