Recovering lost data with Adobe's Automatic Data Recovery If your hard drive has crashed and you can't recover your files, the last-ditch tool you may want to use is the Automatic Data Recovery (ADR) tool. ADR looks for data lost on your hard drive and copies it to an external location. It's probably been a while since you've used it, but the basics remain the same. First, open the software, but don't use it to recover a single file. Select a few files from the list and then choose Start. When the tool opens, go through its options and configure it so that it can perform the best type of recovery. For example, if you've lost your MP4 files, configure it to find and recover the files for you. After you configure ADR, select Start. After the tool scans your hard drive for lost files, it moves the data into a folder on your hard drive or to an external device such as a portable hard drive. It prompts you to copy the data to your desktop or back into a folder on the hard drive. Depending on the type of data you recover, it may take a while. You can open the recovered data by double-clicking it. In a Windows environment, it may open with a subfolder named after the lost file's path. In a Mac environment, it opens to a folder that begins with a number and ends in `.dmg`, which stands for disk image. Photoshop now has built-in support for ADR, but you can use it as a standalone tool. Look in the Photoshop program's Preferences | Save | Preferences menu. The options for ADR will be there if you use the program to recover a file, although it is not difficult to configure Photoshop to use the program to find and recover all your lost files at once. The features of the current version of ADR are not as robust as they were in its previous version. If you're interested in using it to save time and perhaps save your work, it's worth a look.
